

Obstetric Virtual Care

Keeping watch with your bedside teams throughout labor and delivery

Obstetric virtual care centers are staffed by expert clinicians who partner with L&D teams across the health system to provide an extra layer of support during critical moments of care. This shared vigilance helps promote situational awareness, standardized communication, and focused clinical attention when it matters most.

How It Works

Powered by PeriWatch Vigilance[®], virtual care centers continuously monitor data from the EMR and your existing central monitoring system to notify clinicians when maternal vital signs, fetal heart-rate patterns, or labor progress exceed hospital-defined safety thresholds — promoting improved quality and safety system-wide.

Advantages for Your Organization

- ✓ Provide enterprise-wide perinatal monitoring from a centralized location
- ✓ Support L&D, antepartum, and postpartum units remotely — whether from across the hall or across town
- ✓ Empower experienced L&D staff to monitor, assess, and escalate emerging concerns
- ✓ Address human factors with functionalities designed to minimize risks tied to distraction, tunnel vision, and normalization of deviance
- ✓ Enable standardized responses across shifts and care teams, regardless of experience level
- ✓ Support the adherence of OB documentation to health system policies
